Note: In real life Roulette a person can place multiple bets, meaning multiple chips on different locations. In this way, they can win and lose money at the same time. Whether they win money or not all depends on the bets they place and the winning number. They'll gain money if the net payout is greater than the net loss.

Version 1 of the Roulette game might ask for user input to test the functionalities of the betting functions and the random number generator. Version 2 will implement classes to create different types of betting users, such as someone who bets inside vs someone who bets outside.
